

DAA

UNIT 1

Introduction to Algorithms

9 hours

Introduction to Algorithms: Algorithm specification, Performance Analysis. Divide and Conquer: The general method: Binary search, finding maximum and minimum, Merge sort, Quick sort, Selection, Strassen's Matrix multiplication.

UNIT 2

The Greedy Method

9 hours

The Greedy Method: The general method, Knapsack problem, Job sequencing with deadlines, optimal storage on tapes, minimum cost spanning trees, single source shortest paths.

UNIT 3

Dynamic Programming

9 hours

Dynamic Programming: The general method, multistage graphs, all pairs shortest paths, optimal binary search trees, reliability design, the travelling sales person problem.

UNIT - 1

MERGE SORT

best, Avg, Worst $\rightarrow O(n \log n)$
cases

- BINARY SEARCH

Divides from middle and searches

But case $\rightarrow O(1)$ Avg and worst cases $\rightarrow O(\log n)$
 (successful search)
 All cases $\rightarrow O(\log n)$ (unsuccessful search)

- FINDING MIN & MAX

6. Finding maximum and minimum

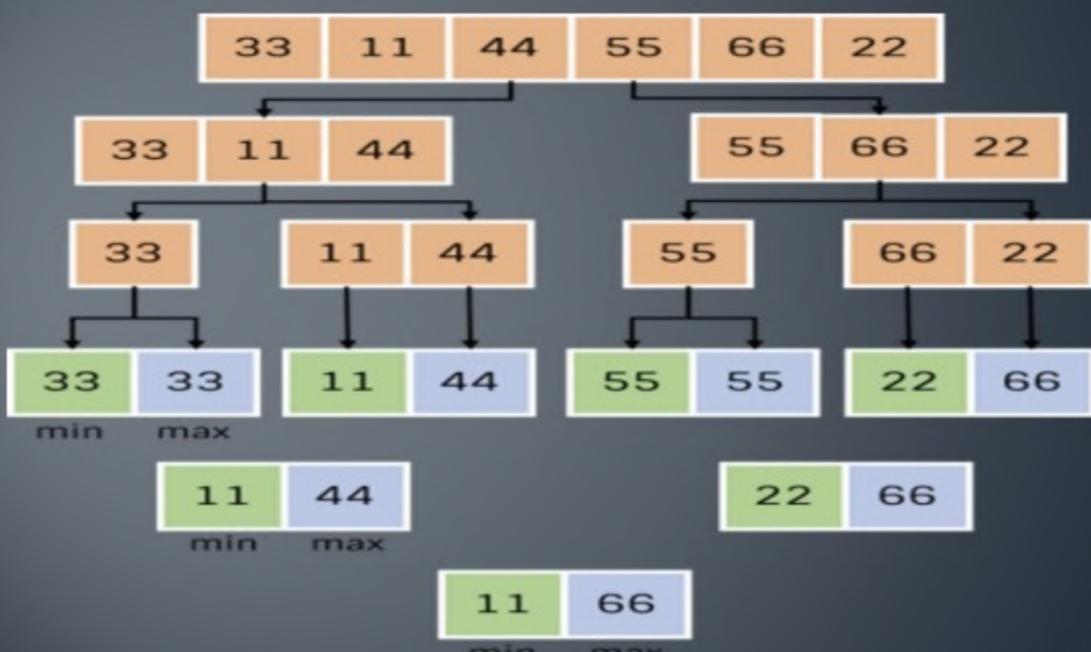

- Divide and conquer approach for Max. & Min problem works in three stages.

Stage1: If a_1 is the only element in the array, a_1 is the maximum and minimum.

Stage2: If the array contains only two elements a_1 and a_2 , then the single comparison between two elements can decide the minimum and maximum of them.

Stage3: If there are more than two elements, the algorithm divides the array from the middle and creates two sub-problems. Both sub-problems are treated as an independent problem and the same recursive process is applied to them. This division continues until sub-problem size becomes one or two.

For example, find max and min from the sequence $<33, 11, 44, 55, 66, 22>$ using divide and conquer approach

- STRASSEN'S MATRIX MULTIPLICATION

② Strassen's algorithm 2×2 Matrix multiplication

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \quad B = \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$$

$$M_1 = (A_{11} + A_{22}) * (B_{11} + B_{22}) = (1+4)(5+8) = 5 \times 13 = 65$$

$$M_2 = (A_{21} + A_{22}) * B_{11} = (3+4) \times 5 = 7 \times 5 = 35$$

$$M_3 = A_{11} * (B_{12} - B_{22}) = 1 \times (6-8) = 1 \times (-2) = -2$$

$$M_4 = A_{22} * (B_{21} - B_{11}) = 4 \times (7-5) = 4 \times 2 = 8$$

$$M_5 = (A_{11} + A_{12}) * B_{22} = (1+2) \times 8 = 3 \times 8 = 24$$

$$M_6 = (A_{21} - A_{11}) * (B_{11} + B_{12}) = (3-1) \times (5+6) = 2 \times 11 = 22$$

$$M_7 = (A_{12} - A_{22}) * (B_{12} + B_{22}) = (7+8) \times (2-4) = -2 \times 15 = -30$$

$$C_{11} = M_1 + M_4 + (-M_5) + M_7 = 68 + 8 - 24 - 30 = 19$$

$$C_{12} = M_3 + M_5 = -2 + 24 = 22$$

$$C_{21} = M_2 + M_4 = 35 + 8 = 43$$

$$C_{22} = M_1 + M_3 - M_2 + M_6 = 65 - 35 - 2 + 22 = 50$$

$$C = \begin{bmatrix} 19 & 22 \\ 43 & 50 \end{bmatrix}$$

UNIT-2

- KNAPSACK PROBLEM

(ii) Knapsack problem

$$n=7, \quad u_m = 15 \quad (p_1, p_2, \dots, p_7) = (10, 5, 15, 7, 6, 18, 3) \\ (w_1, w_2, \dots, w_7) = (2, 3, 5, 7, 1, 4, 1)$$

$n \rightarrow$ no. of items $u_m \rightarrow$ max weight
 $p \rightarrow$ profits $w \rightarrow$ weights

Calculating profit-to-weight ratio $\left(\frac{p_i}{w_i} \right)$

$$R_1 = \left(\frac{10}{2} \right) = 5 \quad R_5 = \left(\frac{6}{1} \right) = 6$$

$$R_2 = \left(\frac{5}{3} \right) \approx 1.67 \quad R_6 = \left(\frac{18}{4} \right) = 4.5$$

$$R_3 = \left(\frac{15}{5} \right) = 3 \quad R_7 = \left(\frac{3}{1} \right) = 3$$

$$R_4 = \left(\frac{7}{7} \right) = 1$$

Sorting based on ratio.

$R_5, R_1, R_6, R_3, R_7, R_2, R_4$

Adding items to knapsack based on sorted order

① Item 5 : Profit 6, weight 1 Remaining capacity = 14

② I₁ : p :- 10, w :- 2, RC = 12

③ I₆ : p :- 18, w :- 4, RC = 8

④ I₃ : p :- 15, w :- 5, RC = 3

⑤ I₇ : p :- 3, w :- 1, RC = 2

There is no remaining capacity for adding items.

Total profit : $6 + 10 + 18 + 15 + 3 = 52$

Total weight : $1+2+4+5+1 = 13$

Max profit : 52 Min weight : 13

- JOB SCHEDULING WITH DEADLINES

Q) What is the solution generated by the job sequence with deadlines

$$m=7 \quad (b_1, b_2, b_3, \dots, b_7) = (3, 5, 20, 18, 1, 6, 30)$$

$$(d_1, d_2, \dots, d_7) = (1, 3, 4, 3, 2, 1, 2)$$

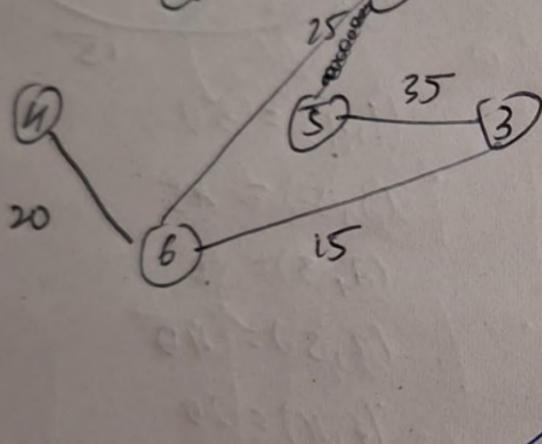

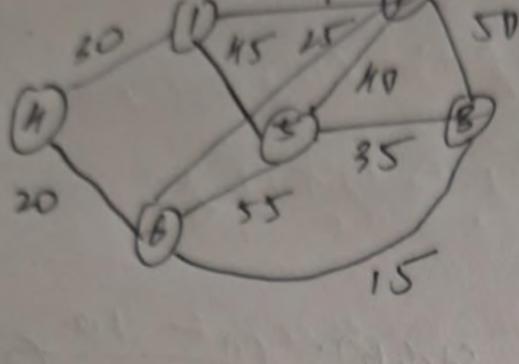

Task	Profit	D _L	Task	Profit	D _L

4			8_1	15_4	∞

- OPTIMAL UTILISATION OF TAPES

For e.g. Suppose there are 3 programs of lengths 2, 5 and 4 respectively. So there are total $3! = 6$ possible orders of storage.

ORDER	TOTAL RETRIEVAL TIME	MEAN RETRIEVAL TIME
1 1 2 3	$2 + (2 + 5) + (2 + 5 + 4) = 20$	20/3
2 1 3 2	$2 + (2 + 4) + (2 + 4 + 5) = 19$	19/3
3 2 1 3	$5 + (5 + 2) + (5 + 2 + 4) = 23$	23/3
4 2 3 1	$5 + (5 + 4) + (5 + 4 + 2) = 25$	25/3
5 3 1 2	$4 + (4 + 2) + (4 + 2 + 5) = 21$	21/3
6 3 2 1	$4 + (4 + 5) + (4 + 5 + 2) = 24$	24/3

It's clear that by following the second order in storing the programs, the mean retrieval time is least.

DEFN - 3

- ALL Pairs shortest Path

All Pairs shortest Path

$A^k(i,j)$ shortest path b/w vertices $i \& j$ where k is the intermediate node.

$$A^k(i,j) = \min [A^{k-1}(i,j), A^{k-1}(i,k) + A^{k-1}(k,j)]$$

Let $k=1$

$$\begin{matrix} & 1 & 2 & 3 \\ \begin{matrix} 1 \\ 2 \\ 3 \end{matrix} & \left[\begin{matrix} 0 & 4 & 15 \\ 8 & 0 & 2 \\ 3 & \infty & 0 \end{matrix} \right] & A^1(1,2) = \min [A^0(1,2), A^0(1,1) + A^0(1,2)] \\ & & = \min [15, 0+4] = 4 \end{matrix}$$

$$A^1(1,3) = \min [A^0(1,3), A^0(1,1) + A^0(1,3)] = \min [15, 0+15] = 15$$

$$A^1(2,1) = \min [A^0(2,1), A^0(2,1) + A^0(1,1)] = \min [8, 8+0] = 8$$

$$A^1(2,3) = \min [A^0(2,3), A^0(2,1) + A^0(1,3)] = \min [2, 8+15] = 2$$

$$A^1(3,1) = \min [A^0(3,1), A^0(3,1) + A^0(1,1)] = \min [3, 3+0] = 3$$

$$A^1(3,2) = \min [A^0(3,2), A^0(3,1) + A^0(1,2)] = \min [\infty, 3+4] = 7$$

$$\text{for } k=1 \rightarrow \begin{matrix} & 1 & 2 & 3 \\ \begin{matrix} 1 \\ 2 \\ 3 \end{matrix} & \left[\begin{matrix} 0 & 4 & 15 \\ 8 & 0 & 2 \\ 3 & 7 & 0 \end{matrix} \right] \end{matrix}$$

$$A^2(1,2) = \min [A^{2-1}(1,2), A^{2-1}(1,2) + A^{2-1}(2,2)] = \min [4, 4+0] = 4$$

$$A^2(1,3) = \min [A^1(1,3), A^1(1,2) + A^1(2,3)] = \min [15, 4+2] = 6$$

cost of D₂ is added to (1)

$$S_2^2 = \left\{ \left(\frac{0.864}{0.9 \times 0.96}, 60 \right), \left(\frac{0.9504}{0.99 \times 0.96}, 90 \right) \right\} \quad \begin{aligned} & 1 - (1 - \gamma_2)^2 \\ & = 1 - (1 - 0.8)^2 \\ & = 1 - 0.2^2 \\ & = 1 - 0.04 \\ & = \underline{\underline{0.96}} \end{aligned}$$

= (0.96) 30

this is not feasible
as the cost exceeds that if
it is not possible to buy devia³

$$S_3^2 = \{(0.8928, 75), (-, 105)\} \quad 1 - (1 - \delta_2)^3$$

\downarrow
 $30 + 45$

$$0.9 \times 0.992 \quad 1 - (1 - 0.8)^3$$

$$1 - (10.2)^3$$

$$1 - (0.008)$$

$$= (0.992) 45$$

$$S_2^2 = \{(0.72, 45), \cancel{10.792, 75)}, \boxed{(0.864, 60)}, (0.8928, 75)\}$$

$\boxed{\quad}$

cost is increasing
but reliability is decreasing
do, it is removed.

Consider D₃,

$$S_1^3 = \{(0.36, 65), 10.432, 80), (0.4464, 95)\}$$

\downarrow
 0.75×0.5

$65 + 20 \quad \dots$ like that
with ② and
 c_3 and δ_3

$$S_2^3 = \{(0.54, 85), \boxed{(0.648, 100)}, (-, 115)\} \quad \delta_3 = 0.5$$

\downarrow
 0.72×0.75

$85 + 10 \quad \dots \text{do on}$

$$1 - (1 - \delta_3)^2$$

$$1 - (1 - 0.5)^2$$

$$1 - 0.25$$

$$(0.75) 40$$

$$S_3^2 = \{(0.63, 105), (-, 120), (-, 125)\}$$

$$1 - (1 - \delta_3)^3$$

$$S^3 = \{(0.36, 65), (0.432, 80), \cancel{(0.4464, 95)},$$

$$1 - (1 - 0.5)^3$$

$$1 - 0.125$$

$$(0.54, 85), (0.73, 105), \underline{(0.648, 100)} \} \quad (0.875) 60$$

Ans: Max vulnerability $\rightarrow 0.648$ cost $\rightarrow 100$

$D_3 \rightarrow 2$ copies as it is present at S_2^3

$D_2 \rightarrow 2$ copies as it is present at S_2^2

$D_1 \rightarrow 1$ copy as it is present at S_1^1

Ans \rightarrow $D_1 \ D_2 \ D_3$
 1 2 2

$$\pi_{\delta_i} = \boxed{0.648}$$

$$\Sigma c_i = \boxed{100}$$
